

Luxeos

Colour beyond comparison

Unmatched in light quality. Unrivalled in performance.

Combining advanced multi-channel LED technology and precision optics, the Luxeos range has been designed to deliver exceptional quality of light and performance.

Perfectly suited to a wide range of exterior applications - from Floodlighting to distance projection - Luxeos has been engineered to Pulsar's exacting standards and constructed to withstand the toughest environments.

Available in multiple sizes and with a choice of colour-changing LED sources, including RGBW, RGBA and Tunable White, Luxeos offers a flexible architectural lighting solution like no other.

Key design principles

The result of extensive research and development, Luxeos brings together Pulsar’s five key design principles, culminating in an exterior lighting solution capable of delivering unprecedented light quality and performance whilst enduring some of the world’s harshest environments – day after day.

Superior Light Quality

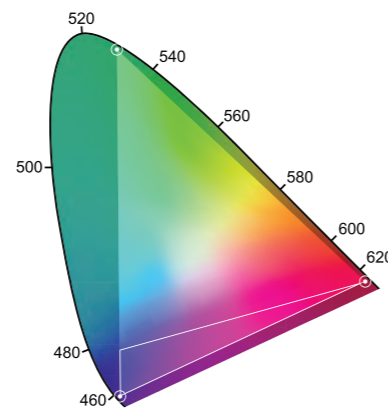

From the outset, Luxeos luminaires have been designed to deliver beautiful, high-quality light. Powered by our QuadCore LED™ Technology which expands the colour gamut, Luxeos offers an extensive array of hues, from vivid saturated colours to subtle pastel shades. The addition of precisely defined white LED chips in Luxeos ensures accurate colour temperatures are achieved, resulting in high CRI (90+) illumination. Furthermore, by hot binning our LEDs, we can maintain consistency within 3 SDCM, even at higher temperatures found in warmer climates.

Outstanding Performance

Following the guiding principle of providing light only where it’s needed, Luxeos utilises Pulsar’s Holographic Beam Shaping™ technology to maximise the luminaire’s optical performance, whilst ensuring light is directed only as required. The advanced optical system enables a wide variety of symmetrical and elliptical Beam distributions from 3° to 80°. Meanwhile, the use of high-powered LEDs and our dynamic power management system, LuxRamp™, ensures Luxeos achieves a high luminous flux, delivering peak intensities of over 1,000,000cd.

Standard Colour Gamut

Luxeos Colour Gamut

Key design principles

Seamless Control

For dynamic lighting systems, the ability to seamlessly transition between scenes is essential, however the speed and magnitude of these changes can sometimes lead to visible steps in light intensity. To combat this, Luxeos features our InterBit Smoothing™ technology which results in smoother fades and transitions. Luxeos luminaires also utilise DMX; an industry standard lighting control protocol that is both incredibly fast and robust. This is particularly important for schemes that feature multiple fixtures as it ensures any changes remain synchronised.

Built to Last

The capacity to withstand extreme weather conditions, as well as large fluctuations in ambient temperature were crucial design considerations for the Luxeos range. By utilising a robust aluminium exterior housing and toughened glass optical cover, Luxeos is able to endure the most challenging environments, including marine locations thanks to a corrosion-resistant outer coating. Internal thermal management coupled with a passive heatsink design ensures product reliability and longevity, helping Luxeos to achieve a 100,000 hour lifetime.

Ease of Installation

For Luxeos, we've streamlined the installation process with the introduction of QuickLink+™; an intuitive plug-and-play system that allows wiring to be completed during the first fix stage. With QuickLink+, a single IP68 connector carries both power and data to the luminaire, helping to maximise ingress protection. Once installed, Luxeos is easy to commission using RDM and the luminaires can be locked in pan and tilt to maintain the focal position of the light. Optional mounting plates are also available to further aid with installation.

Technologies

Luxeos integrates Pulsar's latest technical innovations with state-of-the-art LED technology to set a new standard for dynamic architectural lighting. From intelligent power and thermal management to ultra-smooth, flicker free LED dimming, Luxeos combines advanced features to deliver enhanced luminaire performance, maximising light output and providing superior quality of light.

QuadCore LED Technology

Offering exceptional colour consistency and accuracy, QuadCore LED Technology enables a variety of optimised colour-mixing solutions. By combining four individually binned LED chips with precisely defined chromaticity coordinates, QuadCore LED Technology can deliver perfectly tuned white and coloured light.

LuxRamp Power Management

Our propriety LuxRamp technology eliminates the inefficiencies found in traditional multi-channel LED products. Through dynamic power management, LuxRamp is able to boost the power sent to individual channels to maximise the total light output of the luminaire, increasing brightness by up to 40%.

Holographic Beam Shaping

Delivering precisely controlled light distributions with perfect uniformity, Holographic Beam Shaping (HBS) technology offers outstanding optical performance and flexibility. From ultra-narrow spots to extra wide Floods, plus elliptical Beams, HBS provides excellent centre to edge illumination whilst minimising Beam artifacts.

InterBit Smoothing

Offering seamless fades and transitions, InterBit Smoothing technology adds intelligent dimmer control to Luxeos luminaires. By automatically maximising the number of dimming steps between lighting scenes, InterBit Smoothing effectively eliminates any noticeable incremental changes in light output during transitions.

Luxeos features

*Luxeos Flood Range Only

LED light sources

Luxeos can be specified with a choice of four dynamic LED light options to ensure that no matter what your individual project needs are, we'll have the right solution for you. Powered by our QuadCore LED Technology, all Luxeos sources offer high-quality, controllable light, unrivalled in performance and colour accuracy.

VividColour

Ideal for applications which require a mix of white and coloured light, our VividColour light options all feature separate red, green and blue channels, plus the addition of a white light LED. To maintain consistency, the wavelength of each coloured LED has been carefully selected; this includes the use of a deep royal blue that widens the colour gamut – extending the range of blue, magenta and cyan colours. When mixed, these sources produce a full

spectrum of colours, from saturated primaries to subtle pastels.

To provide further refinement, with VividColour, the white light LED can be specified with a cool (5700K), warm (2700K) or very warm (1700K) correlated colour temperature (CCT). This allows the light source to be more closely tuned to the surfaces being lit.

LED light sources

TunableWhite

Our TunableWhite solution is perfect for white light applications where you want to adjust the colour temperature of the light. Whether it's to add dynamism to a scheme, or simply refine the colour of the source, our high CRI TunableWhite option is the ideal choice.

Whilst most variable white sources use two-channels to create their light, TunableWhite uses a mix of cool (5700K), warm (2700K) and very warm (1700K) LEDs to generate a white light that is more closely aligned to the blackbody curve and therefore far more natural in appearance. Furthermore, because TunableWhite utilises our QuadCore LED technology, we can add additional warm LEDs to the mix, delivering consistent intensity across the temperature range.

Colour Mixing Explained

Multi-channel LED luminaires blend different coloured sources to generate their light. There are two main ways for this colour mixing to be achieved; inside the optic, and outside the optic. Luxeos luminaires employ both mixing types, depending on the application.

In-Optic Mixing

Used in our Luxeos Flood luminaires. In-Optic Mixing blends light from the four separated LEDs inside the optic, resulting in a single-coloured, uniform Beam projected from the luminaire. This method of mixing is generally preferred as it minimises colour fringing, however, it is limited to wider Beam distributions of 10° and above.

Out-of-Optic Mixing

Used in our Luxeos Beam luminaires. With Out-of-Optic Mixing, every LED has its own separate optic, with the light from each source mixing outside the luminaire to generate the coloured light. This method of mixing allows us to deliver ultra-narrow Beam distributions down to 3°, ideal for distance projection applications.

Luxeos range overview

Luxeos has been designed to support a variety of exterior applications, from Floodlighting to distance projection. Available in three sizes, the range is divided into Flood and Beam luminaires, offering a wide selection of light distributions and power options.

Range Specifications

Electrical	
Operative Voltage	120V - 277 V AC
Operating Frequency	50/60 Hz
Electrical Class	Class I
Operational	
Temperature Range	-40° C to +50° C
Thermal Management	Internal; passive heatsink
Lifetime (L70) at 50°C	100,000 hrs
Control	
Control Protocol	DMX 512; 4-Channel (VC), 3-Channel (TW)
Dimming Resolution	8-Bit (with InterBit Smoothing)
RDM Compliant	Yes; for commissioning & feedback
Connection	QuickLink+ cable for power & data

Construction	
Body	LM6 Aluminium
Glazing	Toughened glass
Seals	Silicone
Coating	Corrosion resistant polyester powder coat
Finishes	Black; Aluminium; White
Movement	
Pan	360°
Tilt	+45° to -90°
Certification	
Ingress Protection	IP66
Impact Protection	up to IK10*
Compliance	CE, UKCA

*Luxeos Flood 9 / 18 & Luxeos Beam 20 / 40 luminaires rated IK09

Bespoke solutions

For over 50 years, Pulsar has worked with lighting designers, architects and system integrators to help bring their visions to life. During this time, we've developed a range of architectural luminaires and control systems designed to meet the needs of our customers, however, we understand that for some projects, a unique solution may be required. For this reason, at Pulsar, we're able to offer project-based modifications of our products to meet the challenges of your design brief.

Product Modifications

From custom RAL finishes to specific Beam angles, we're able to modify our range of specification-grade luminaires to help satisfy the requirements of your individual lighting application.

Bespoke Design

For projects that require a more bespoke design, our team of in-house designers and engineers can work with you to develop a unique solution. Whether its fabricating a specific mounting bracket, or configuring a custom LED population, our experts are here to support you from concept to completion.

Here To Help

Our experienced design and engineering teams are on hand to provide bespoke support throughout the product specification and lighting design phases of any project. If you require further information or assistance on your next project, please contact us.

Bringing architecture to life

As a leading architectural lighting brand, Pulsar designs, develops and produces high-quality luminaires and control systems that transform architectural projects with light. For over 50 years, Pulsar has delivered unique lighting solutions across a wide range of sectors; including architectural, entertainment and creative projects.

Our mission is to bring creative, dynamic architectural lighting projects to life. As pioneers within the lighting technology industry, we have a proven record in electrical innovation. Since 1970 we have focused on harnessing the latest technologies to deliver specification-grade lighting equipment for interior and exterior applications.

Now part of DW Windsor, Pulsar continues to embrace the latest in high-powered LED technology to produce feature-rich lighting products that offer a superior quality of light and performance. Our luminaires are designed, manufactured and tested to the highest standards at our facilities in Hertfordshire.
